*The proof is in the pudding,
and here it is!!!!*

Superod acquired several Fiberod/JCPS new Gen 2 rods and conducted a test to prove who has the best end fitting.

The parameters of the test are as follows:

JCPS rods were acquired and cut off to 6' leaving enough rod body to attach a Superod end fitting to the opposite end. This allows a direct test of the 2 end fittings opposing each other, on the JCPS rod body.

The destruction tester was set at $\pm 30,000$ lbs max load and ± 0 lbs minimum load cycling at 20 spm. The rod cycled 1,276,654 strokes at these loads.

At this point the decision was made to increase the max loading to 40,000 lbs. It took only 3 strokes at

the increased load for the Fiberod/JCPS end fitting to pull off.

Superod would be very happy to re-run this test with customers, John Crane representatives, competitors or any other interested party supervising the test.

Superod feels it is very important to all users of fiberglass rods to know and understand what they are buying.

If a well had been running at 8 spm the John Crane end fitting would have failed after ± 110 days. The cost to correct this failure would be $\pm \$20,000$. When this is added to the purchase price it should become very obvious which of these rods is more efficient and least expensive in the long run.

This test does not speak to the fact that Superod rod bodies are also superior to the JCPS/Fiberod rod body. Tests can also be conducted to prove this point. When a superior end fitting is connected to a superior rod body the results are compounded.

Your wells deserve the best, and least expensive sucker rod.

BUY SUPEROD!!!! We are the best that has ever existed and we will be happy to prove it.
